3D printable translational stage for LaVision Light Sheet Microscope

In this technical note we present a fully 3D printable linear stage designed to give the researchers a tool to acquire equally spaced images using the LaVision Light sheet Microscope. The pitch of the M2 thread measures 0.4 mm therefore, rotational movements of half or even a quarted of revolution of the screw placed on the middle will be linear increments of 200 and 100 μ m respectively. The range of movement of the platform is 36 mm.

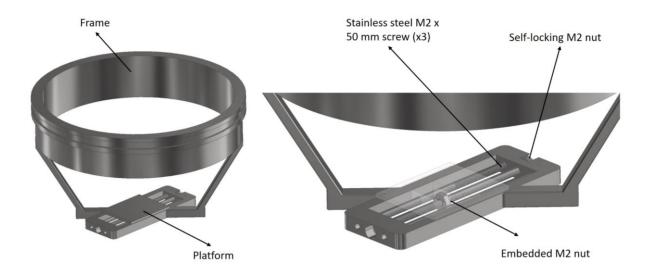

Figure 1: Design of the stage on the CAD software.

Assembly instructions

This device has been printed using a Form 3 3D printer filled with clear V4 resin. It has been printed using the standard settings (100 µm resolution).

- 1- Remove the support material of both pieces.
- 2- Use a hand tap set M2 size to thread the holes for the screws.

Figure 3: M2 tap hand tool (left) and Threaded M2 holes (right).

- 3- Insert the two M2 screws that act as a guides while you place the platform holes on the path of the screws.
- 4- Now insert the embedded M2 nut and insert the center M2 screw threading inside the embedded nut.
- 5- Insert the M2 self-locking nut on the other side of the central screw, this nut limits the axial displacement of the screw. The nut has to be threaded on the nylon side. Alternatively, a regular M2 nut can be used with thread locking glue inside the thread (RS Components 693-848).
